Job Market Paper

Who Pays, Who Adopts? Efficiency and Equity of Residential Solar Policy

<u>Abstract</u>: This paper studies the equilibrium outcomes of alternative residential solar subsidies within a nested discrete choice framework. Households endogenously determine whether to adopt solar photovoltaic and how much capacity to install, implying intensive effects of the policies. Furthermore, households respond heterogeneously to subsidies: switching from a subsidy based on future production to one that reduces upfront installation costs shifts solar photovoltaics adoption toward lower-income households, suggesting the feasibility of policy differentiation. The method of raising subsidy also shapes distributional outcomes, and no single subsidy can achieve both efficiency and equity objectives. These findings highlight the importance of careful subsidy policy design.

Working Papers

Flexibility in Power System: Market Design Matters (with Bert Willems)

<u>Abstract</u>: The growing share of renewable energy requires sufficient investment in power system flexibility. In this paper, we frame a three-stage peak-load pricing model consisting of investment, commitment, and production, considering that electricity generation is costly to adjust on short notice. The results demonstrate the importance of increasing time granularity in electricity markets with efficient state-contingent prices. Adapting the idea of real options theory, which states that waiting is valuable, flexible firms avoid producing in the low-demand state and earn a premium to recoup investment costs. On top of that, this paper discusses the efficiency of alternative market designs in the investment of flexible assets. Without an efficient real-time market, day-ahead forward price results in under-investment in flexible technologies and over-investment in inflexible ones. This distortion, in theory, can be corrected by a time-varying options market with technology-specific payment while any centralized auction fails to achieve optimum. Finally, this work briefly illustrates the effect of demand flexibility, showing that an increase in demand response does not necessarily reduce the reliance on production flexibility if rationing is done randomly.

Electricity Forward Premium: Renewable Integration and Skewness Preference (with Ronald Huisman & Bert Willems)

<u>Abstract</u>: This paper presents new components that explain the risk premium priced in electricity forward and futures contracts. These components relate to the inclusion of renewable power sources in electricity markets. We build upon the equilibrium pricing model presented by Bessembinder and Lemmon (2002), which comes from a time wherein intermittent renewable power supply was negligible. We extend their framework by including intermittent supply from zero marginal costs renewable power sources such as wind and solar and by assuming that agents consider mean-variance-skewness preferences instead of mean-variance only. Beyond variance and skewness of wholesale spot prices as components found before, we show that components that relate to the covariance and coskewness between renewable supply and spot prices explain the power forward risk premium as well. We find empirical evidence that these new components are statistically significant and improve the explanatory power of empirical regressions. Our results suggest the importance of considering the asymmetry of renewable supply shocks in explaining electricity forward premiums.

Research Visits

Toulouse School of Economics, *Toulouse*March-April 2025

Conferences & Seminars

ASSA 2026, Philadelphia EEA 2025, Bordeaux IAEE International 2025, Paris	Jan 2026 Aug 2025 June 2025
FMA European 2025, Limassol	June 2025
Canadian Economics Association 58th Annual Meetings, Online	May 2024
Conference on Climate and Energy Finance, Hannover	Nov 2023
Energy Workshop, Toulouse	Oct 2023
EEA-ESEM 2023, Barcelona	Aug 2023
CEEM Ph.D. Conference, Paris	Apr 2023
Young Energy Economists and Engineers Seminar, Cobbenhagen	Sep 2022
6th AIEE Energy Symposium: Current and Future Challenges to Energy Security, Online	$\mathrm{Dec}\ 2021$

Workshops

Engineering Energy Summer School by Frank Wolak (Stanford), Stockholm	June 2024
Empirical Environmental and Energy Economics by Hunt Allcott (Stanford), Amsterdam	June 2023
Energy Market Winter School, Oppdal	Feb 2022
Energy Transition Empiric Workshop by Mar Reguant (Northwestern), Online	Aug 2021

Teaching Experience

Tilburg University, Teaching Assistant	
Contract Theory, Graduate level	2024-2025
Information Economics, Bachelor level	2023-2025
Game Theory, Graduate level	2020-2023
Intermediate Economics, Bachelor level	2022
Microeconomics 1, Bachelor level	2021

Renmin University of China, Teaching Assistant

Advanced Microeconomics, Graduate level 2017

Awards & Grants

Funded PhD program, €150000, Tilburg University	2021-2025
Jenny Ligthart Prize (best research master), €1500, Tilburg University	2022
Koopmans Scholarship, €48000, Tilburg University	2019-2021
Academic Scholarship, RMB51600, Renmin University of China	2016-2018
College Academic Scholarship, Central University of Finance and China	2014-2015
Second Prize, Students' Platform for Innovation and Entrepreneurship Training Program	2014
